IN 2014, CREWS ON THE CAPX2020 Brookings County-Hampton project have been hard at work installing foundations, setting structures, stringing conductor and installing interphase spacers.

Five of the eight segments of the line are now energized and other major milestones have been met. Crews have installed the last foundation, and by year end, crews are expected to set the final pole and finish construction work in South Dakota. Helicopters continue to be used at times for stringing conductor and attaching components.

Next year, the entire project will be completed and energized. We appreciate your cooperation through 2014, and wish you a happy 2015. Happy Holidays!

2014 by the numbers
- Approximately 30,000 cubic yards of concrete were poured
- Approximately 600 poles were set
- Approximately 75 miles of line were strung
About the project
The Brookings County-Hampton project is a double circuit 345 kilovolt (kV) transmission line (some segments constructed as double circuit capable) being built between the Brookings County Substation near Brookings, S.D., and the Hampton Substation in Hampton, Minn. The line is comprised primarily of single pole structures attached to concrete foundations, spaced about five per mile. Construction began in April 2012, and is expected to be complete in 2015.
